adolescent health

Supported by The Royal Children's Hospital Foundation

# Do you have cerebral palsy and are aged 25–35?

We're inviting adults with cerebral palsy to share their experiences of pain during childhood in an interview.

## What's the study about?

**This study is about understanding how people with cerebral palsy experience pain during childhood.**

We're interviewing adults aged 25–35 to learn about their pain journey growing up – what helped, what didn't, and how pain changed over time. The goal is to understand the different experiences of pain so that we can better identify and treat it.

## What's involved?

- A short demographics questionnaire
- A 60–90 minute interview (via Zoom)
- Talking about your experiences with pain growing up
